**11 Д48.** Строение небольших углеродных кластеров: циклическое основное состояние кластера C<sub>6</sub>. Structures of small carbon clusters. Cyclic ground state of C<sub>6</sub>. Raghavachari Krishnap, Whiteside R. A., Popple J. A. «J. Chem. Phys.», 1986, 85, № 11, 6623—6628 (англ.) Место хранения ГПНТБ СССР

Проведены неэмпирич. расчеты равновесных конфигураций и энергий всех шести изомерных модификаций кластера C<sub>6</sub>. Расчеты выполнены в приближении Хартри—Фока с расширенным базисом, включающим набор поляризационных ф-ций *d*-типа для каждого атома углерода. Корреляционные эффекты учитывались в рамках теории возмущений Меллера—Плессета четвертого порядка. Результаты расчетов показывают, что основным электронным состоянием кластера C<sub>6</sub> является циклическая синглетная структура с шестью π-электронами (плоская конфигурация с симметрией D<sub>3h</sub>, <sup>1</sup>A'). Считавшаяся ранее основной линейная <sup>3</sup>Σ<sub>g</sub><sup>-</sup> структура имеет энергию на ~10 ккал/моль больше. Оценена теплота образования кластера C<sub>6</sub> ΔH ≈ 281 ккал/моль, что согласуется с эксперим. данными. В. М. Стрельчена

1986

106: 126193r Structures of small carbon clusters: cyclic ground state of C<sub>6</sub>. Raghavachari, Krishnan; Whiteside, R. A.; Pople, J. A. (AT and T Bell Lab., Murray Hill, NJ 07974 USA). *J. Chem. Phys.* 1986, 85(11), 6623-8 (Eng). Accurate ab-initio calcns. were done to investigate the nature of the structures and energies of different C<sub>6</sub> isomers. The effects of polarization functions and electron correlation were included in these calcns. A cyclic singlet structure with six  $\pi$ -electrons (planar D<sub>3h</sub>, 'A') is the ground state. The linear  $^3\Sigma_g^-$  structure lies about 10 kcal/mol higher in energy. The heat of formation of C<sub>6</sub> estd. to be  $\Delta H_0^\circ \approx 281$  kcal/mol.

Б 9 Б1065. Сравнение теоретических и экспериментальных данных для системы C<sub>6</sub>(г). Comparing theoretical and observed data in the C<sub>6</sub>(g) system. Slania Z. «Chem. Phys. Lett.», 1987, 142, № 6, 512—514 (англ.)

На основании лит. результатов неэмпирич. расчетов стационарных точек на потенциальной Пв C<sub>6</sub> («J. Chem. Phys.», 1986, 85, 6623) интерпретированы эксперим. данные по равновесию пара C<sub>6</sub> над графитом. Неэмпирич. расчеты указывают, что наименьшей энергии отвечает циклич. изомер C<sub>6</sub> ( $D_{3h}$ ), а линейная форма ( $D_{\infty h}$ ) имеет энергию выше на 42 кДж/моль. Расчет статистич. сумм с вычисл. молек. постоянными при т-ре эксперимента 2500 К показал, что наибольший вес в паре тем не менее должен иметь линейный изомер (до 95%). Суммарная для всех изомеров константа равновесия  $1,36 \cdot 10^{-12}$  атм оказалась лишь на 8% меньше эксперим. величины, что является примером очень хорошего согласия эксперим. и теорет. величин.

109: 99140z Isomerism of carbon C<sub>6</sub>(g) cluster and its manifestations in the system thermodynamics. Slanina, Zdenek (J Heyrovsky Inst. Phys. Chem. Electrochem., Czech. Acad. Sci. CS-121 38 Prague, Czech.). *Thermochim. Acta* 1988, 127, 237-41 (Eng). In contrast to earlier conclusions based on simple models, the newest calcns. showed that the C<sub>6</sub>(g) cluster isomer of the lowest potential energy is a cyclic structure of D<sub>3h</sub> symmetry. The evaluation given in the present study, however, shows that increasing temp. increases the importance of the energetically higher linear structure which becomes the dominant component of the equil gaseous mixt. of isomers in the end. Therefore, the D<sub>3h</sub> structure alone cannot be used in simulating the C<sub>6</sub>(g) system thermodyn., and it is necessary to apply the overall terms including the contributions of all the isomers. The effects of isomerism are esp. noticeable with the heat capacity term whose temp. dependence shows a markedly extremal course. This study fundamentally changes both the values of the quantities used so far and the approaches to the thermodyn. of this system.

121: 213517c Ab initio study of the energy difference between the cyclic and linear forms of the C<sub>6</sub> molecule. Pless, V.; Suter, H. U.; Engles, B. (Inst. Physikalische und Theoretische Chem., Universitaet Bonn, 53115 Bonn, Germany). *J. Chem. Phys.* 1994, 101(5), 4042-8 (Eng). The energy difference between the three

lowest-lying isomers of C<sub>6</sub>, the linear  $\Sigma_g^+$  state, and the two ring forms, the benzene structure ( $^1A_{1g}$ ) possessing D<sub>6h</sub> symmetry and a distorted cyclic form ( $^1A_1'$ , D<sub>3h</sub> symmetry) have been calcd. using various ab initio methods. Variational methods such as multireference CI (MR-CI) and complete active space second order perturbation treatment (CASPT2) have been applied, as well as perturbational treatments and coupled cluster calcns. (CCD). The correlation of all valence shell electrons is found to be important for a balanced description of the isomers of C<sub>6</sub>. Methods which do not account for higher-order effects appropriately proved to be unsuitable for calcg. the energy difference correctly. The results from MR-CI methods show that the isomers are close in energy with the cyclic forms somewhat lower than the linear form. The ring form possessing D<sub>3h</sub> symmetry ( $^1A_1'$ ) is found to be the lowest-lying structure.

The cycling process produced a matrix sandwich with regions of high C d. alternating with layers of Ar. FTIR measurements including extensive <sup>13</sup>C isotopic data, supported by ab initio calcns., allow the assignment of a band at 1694.7 cm<sup>-1</sup> to the ν<sub>4(e)</sub> fundamental of cyclic C<sub>6</sub>. This represents the 1st conclusive identification of a small cyclic neutral polycarbon. Addnl., a vibration previously obsd. at 1710.3 cm<sup>-1</sup> was confirmed as the ν<sub>9(α<sub>u</sub>)</sub> mode of linear C<sub>8</sub>.

127: 300665s Photoelectron spectroscopy of C<sub>4</sub><sup>-</sup>, C<sub>6</sub><sup>-</sup>, and C<sub>8</sub><sup>-</sup>. Xu, Cangshan; Burton, Gordon R.; Taylor, Travis R.; Neumark, Daniel M. (Department of Chemistry, University of California, Berkeley, CA 94720 USA). *J. Chem. Phys.* 1997, 107(9), 3428–3436 (Eng), American Institute of Physics. Photoelectron spectra of C<sub>4</sub><sup>-</sup>, C<sub>6</sub><sup>-</sup>, and C<sub>8</sub><sup>-</sup> were obtained at photodetachment wavelengths 266 nm (4.657 eV) and 213 nm (5.822 eV). The spectra reveal considerably more electronic and vibrational structure than was seen in previous studies of these species. Term values for several low-lying excited electronic states of the neutral C clusters were obtained, as well as new vibrational frequencies for the ground and some of the excited electronic states of the neutral clusters. Assignments of excited electronic states were aided by measurements of the photoelectron angular distributions. A new assignment of the vibrational frequencies for C<sub>6</sub> is in considerably better agreement with ab initio results than our original assignment.

134: 185370x MRD-CI Characterization of Electronic Spectra of Isoelectronic Species  $C_6^-$ ,  $NC_4N^+$ , and  $CNC_3N^+$ . Cao, Zexing; Peyerimhoff, Sigrid D. (Institut fuer Physikalische und Theoretische Chemie, Universitaet Bonn, D-53115 Bonn, Germany). *J. Phys. Chem. A* 2001; 105(3), 627-631 (Eng), American Chemical Society. The structure and stabilities of linear and cyclic isomers of  $C_6^-$  and  $N_2C_4^+$  were studied by DFT, MP2, CISD, and CCSD methods. The linear isomers of  $C_6^-$  and  $NC_4N^+$  are predicted to be the most stable forms. Multireference CI methodol. was used for the calcn. of the doublet and quartet excited states. Assignments to obsd. transitions in matrix spectroscopy of these species are made. The 1st  $X^2\Pi \rightarrow ^2\Pi$  transitions for  $C_6^-$ ,  $NC_4N^+$ , and  $CNC_3N^+$  occur at 1.98, 2.14, and 2.65 eV, resp., showing similar features with large oscillator strengths. A significant difference exists in the  $X^2\Pi_u \rightarrow 1^2\Sigma_g^+$  band system between the  $C_6^-$  and  $NC_4N^+$ . Correlation between the relative MO energy and spectroscopic properties is discussed. The predicted electronic spectra agree well with available exptl. data.
